

Explanation of Logic

Team: Kislay Jha, Vedansh Shah

E4 - Logic Explanation: A standard `SELECT` statement paired with a `WHERE` clause was deployed to isolate anomalous posts. By filtering for instances where `shares > 1500` and `likes < 500`, the query efficiently identifies clickbait or highly viral but poorly received content.

M2 - Logic Explanation: A Common Table Expression (CTE) was used in conjunction with a `LEFT JOIN` between the `users` and `posts` tables. A `CASE` statement was utilized within the CTE to dynamically categorize users into binary groups based on a 25,000-follower threshold. Finally, standard aggregation (`AVG` and `COUNT`) was applied to compare the true engagement parity between the two cohorts.

H6 - Logic Explanation: This query required multi-level aggregation to detect bot-like or manipulated profiles. First, a CTE (`OverallAvg`) calculated the global platform baseline. A second CTE (`UserStats`) aggregated individual user metrics, employing conditional aggregation (`SUM(CASE . . .)`) to flag the specific anomaly where shares eclipse likes. A `CROSS JOIN` brought the global baseline into the final selection, filtering for the strict conditions of `< 10,000` followers, above-average engagement, and the presence of manipulated post ratios.
